Functional & Performance Testing Template
Metro Ticket Generating System

Date	17 October 2026
Project Name	Metro Ticket Generating System using ServiceNow
Maximum Marks	

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Station Selection Validation	Select a source station and a different destination station in the Metro Ticket Booking form.	The form accepts the selected stations and retains the journey details for fare calculation.		
FT-02	Required Field Validation	Try to submit the booking form without selecting required station or travel details.	Submission is blocked and a clear validation message identifies the missing information.		
FT-03	Fare Calculation	Select a supported source/destination pair and enter required travel details; review the displayed fare.	The system calculates and displays the fare according to the configured fare rules.		
FT-04	Ticket Generation	Complete all required fields and submit a valid booking request.	A booking/ticket record is created and a digital ticket with QR code or configured QR representation is made available.		
FT-05	Flow Designer Automation	Submit a valid booking and inspect the configured Flow Designer execution and created record.	The configured flow runs successfully and processes the booking without errors.		
FT-06	Booking Notification	Complete a valid booking and check the configured notification channel.	A booking confirmation is sent with the ticket reference/details or instructions for accessing the QR ticket.		
PT-01	Response Time Test	Use a timer to measure how long the booking form takes to load and a valid request takes to submit.	The form and submission respond within the project's agreed target; record the measured time in Actual Result.		
PT-02	Concurrent Booking Test	Have multiple test users submit valid booking requests at the same time in a controlled test.	The portal remains responsive and requests are processed without lost or unintentionally duplicated records.		
PT-03	QR Ticket Access Test	Open the generated ticket on the supported device/browser and verify the QR code is visible and readable.	The ticket details and QR code are accessible and displayed clearly; record scan verification separately if scanning is implemented.		

Note: *Fill in Actual Result and Pass/Fail only after running the tests against your implemented Metro Ticket Generating System in ServiceNow.*
